

Cloud-based vessel remote monitoring

Marine Broadcast is a cloud-based service for monitoring any vessel equipped with a Marine Watch alarm panel or a Marine Pro 400 or 200 Series engine controller.

- Real-time remote monitoring of vessels or entire fleets at any location
- Web-based, no software or installation needed
- Cell phones and tablets supported
- Free entry level

Secure cloud-based service

Marine Broadcast is a cloud-based service giving users on any remote device running a standard web browser, such as Google Chrome, access to the alarm list of connected vessels. Trusted users can do a secure sign-in and monitor the current status of the vessel(s) they are entitled to see.

Preinstalled in the panel

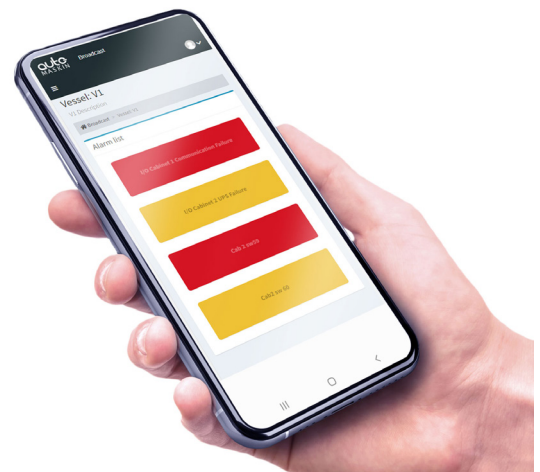

Support for the Marine Broadcast service is preinstalled in all new Marine Watch alarm panels or Marine Pro 400 and 200 Series engine controllers and is included in firmware upgrades for existing panels. To enable the service, the vessel owner only needs to configure the Internet connection and enable the functionality through the menu.

Stationary and mobile devices supported

There is no need for special hardware or software. A standard computer, Chromebook, Android or iPhone device can be used to access the alarm list of any vessel the user is granted access.

Quick setup

Auto-Maskin sets up the company account with an administrator and vessels. Then the administrator can create additional users that will get access to the alarm list for any of the company's vessels.

Free entry level

The entry level functionality of the Marine Broadcast service is free of charge for all owners of a Marine Watch alarm panel or a Marine Pro 400 or 200 Series engine controller. To register for the Marine Broadcast service, order P/N 2500622 or visit <https://www.auto-maskin.com/prod/broadcast>.
